

Methods for Transfecting Cells with Nucleic Acids of Animal Viruses: a Review (Experientia Supplementum) (German Edition)

Transfection, which is the infection of a cell with naked viral nucleic acid with the consequent production of complete virus, was first reported in 1956 for the ribonucleic acid of tobacco mosaic virus. Many reports of transfection, and several reviews of the field, have appeared since then. Crucial for the demonstration of transfection is that the viral nucleic acid is not damaged in the process of obtaining it from the virions, or from the infected tissue. To this end, procedures are designed to minimize the possibilities of degradation of the viral nucleic acid by nucleases present in the biological source. The most common method for preparing viral nucleic acid is the phenol method in which virus or infected-tissue preparations are extracted with phenol. Much of the protein goes down into the phenol phase, whereas the viral nucleic acid stays up in the aqueous phase. The transfection methods for animal virus nucleic acids are of three major kinds: (a) hypertonic methods; (b) insoluble facilitator methods; and (c) polycation methods. These methods have wide applicability to vertebrate cell animal virus NA systems, but any one method does not seem to be highly effective for all such systems with the possible exception of the method using the polycation diethylaminoethyl-dextran. The insoluble facilitator method shows astonishing cell-specificity; that is, it is a very effective method for transfecting some kinds of vertebrate cells, but nearly ineffective for some other kinds.

We've started our countdown to National Handbag Day on October 10, and that means we'll have special features for you every day, right up to the big event! Today, we're here to talk about the intersection of celebrity and accessories, and more specifically, how the two can become intertwined in public consciousness for years. The kinds of stars who carry a particular bag do a lot to shape the market's perception of it and the designer who created it, which is why so many brands give out free bags to stars now: they're hoping to create positive associations. In the cases you see below, though, things came along a little bit more naturally. You can't rush love, after all. Think of a bag-celeb duo we missed? Let us know in the comments!
